B/F3

August 13th

Fine, hot, dry. Continued investigating possible small features in both cuttings

Extreme NW corner B/E3 1/2 metre from post, very disturbed area produced 2 sherds pot.

F1241 Investigated possibility of further P.H. to match with F1219 and B/E3 F1225 at Eastern end of fissure F1218. First Kosselling produced bone and sherds of pot. Appears to be possible P.H. Half sectioned Triangulations from B/F3 posts SE + SW. Large number of finds including several definitive sherds of pot, much bone, pebbles claut and 1 frag flint. Surprisingly, N side of PH has well cut wall, which naturally merges into indefinite E + W sides as hole cuts into fissure. Bottom at 57 cms below surrounding bed rock. Taken out after drawing. Large sherds of pot, 33 cms from level A-B further v. large sherds (40 cms ^{depth}) on SW side, together with much bone. As presumed, only N side can be considered to have a definite side.

F1242 Small shallow almost circular P.H. No burning, no B/F3 finds. Approx centre NE 1.30, SE 8.95. Av diam 20 cms. Depth from 15-20 cms below (1).
