DESCRIPTION CONTINUED
COMMENT

centre. west edge extremely nebulous, with larger stones and lighter earth continuing beyond edge of section. Eastern portion of ? post hole darker with more chipples. Much burnt stone in fill. Fragments of charcoal and burnt tooth found when digging out other half of this shape

PHASING

COMMENT

During removal of 2nd half it became plain that this feature was not a post hole, and that the true edges had not in fact

been found. It appeared to be a pit of some sort, and was thereafter dug as such, and another section taken and drawn. North edge of ? pit continues under baulk but base rising toward it. Edge of feature still nebulous consisting of steps of horizontal but loose bedrock, with one area c 15cm long showing possible curved edges at c. 20cm depth. A promontory of bedrock, partly undercut, with burnt stone under it. Much burnt stone throughout fill. Some bedrock tumbled in to pit lying obliquely against edge.

This appears to be a cut, rather than a natural feature, in view of the nature of the fill, but in the absence of finds, its purpose is conjectured. Soil sample taken for flotation.
